

Q pr. 5 Theory answers

Q what are the ensemble learning methods

→ ensemble learning combine multiple ml models to produce a stronger model. instead of depending on 1 model

Q explain diff between Bagging, Boosting, voting

→ Bagging :- Train multiple model independently on diff sample of the data and combine the predictions

Boosting :- Trains model sequentially, where each new model focus on the error made by previous model

voting :- Combine prediction from different type of models and select final prediction using majority

(4) explain Voting Classifier and Stacking Ensemble.

→ Voting Classifier :- Combines predictions from multiple Classification model in Hard Voting the class receive the most vote is Selected. in soft predicted probability are combine

Stacking :- Combines multiple base models and uses another model called meta model to learn from their predictions
